

d. a base station controller operatively connected to the transceiver array and switching circuit for:

- B1  
complete
- i) monitoring channel utilization in each sector of the cell, and determining the loading in each sector;
  - ii) reassigning a channel from a first sector in a cell to a second sector in the same cell when the loading in the first sector reaches a predetermined threshold; and
  - iii) switching the transceiver corresponding to the reassigned channel from the second sector to the first sector.
-
